**Total Commenal Balance:** The total commensal abundance is a sum-total of the reported commensal bacteria compared to a healthy cohort. Low levels of commensal bacteria are often observed after antimicrobial therapy, or in diets lacking fiber and/or prebiotic-rich foods and may indicate the need for microbiome support. Conversely, higher total commensal abundance may indicate potential bacteria overgrowth or probiotic supplementation.

## **Dysbiosis Patterns**

Dysbiosis Patterns: Genova's data analysis has led to the development of unique dysbiosis patterns, related to key physiologic disruptions, such as immunosuppression and inflammation. These patterns may represent dysbiotic changes that could pose clinical significance. Please see Genova's published literature for more details: https://rdcu.be/bRhzv

Page 2

**Zone 1:** The commensal profile in this zone does not align with profiles associated with intestinal inflammation or immunosuppression. If inflammatory biomarkers are present, other causes need to be excluded, such as infection, food allergy, or more serious pathology.

**Zone 2:** This pattern of bacteria is associated with impaired intestinal barrier function (low fecal slgA and EPX). Patients in this zone have higher rates of opportunistic infections (e.g. *Blastocystis spp. & Dientamoeba fragilis*) as well as fecal fat malabsorption. Commensal abundance is higher in this group suggesting potential bacterial overgrowth.

**Zone 3:** Patients in this zone may have more inflammation compared to those in zone 4. However, commensal abundance is usually higher making use of antimicrobial therapy relatively safer. Patients in this zone may have higher rates of pathogenic infections.

**Zone 4:** This commensal profile is associated with increased intestinal inflammation. IBD patients are more likely to have this pattern of bacteria. Commensal abundance is lower in this zone; therefore, antibiotic use for GI potential pathogens should be used with caution. In addition to standard treatment for intestinal inflammation, modulation of the commensal gut profile is encouraged.

## **Commensal Microbiome Analysis**

## **Commensal Balance**

You Healthy-Pattern Continuum\* 6 4 2 0 2 6 4 10 12 8 Reference Variance Score\*\*

Balanced Represents 95% of healthy individuals Borderline Represents 5% of healthy individuals Imbalanced Represents 60% of unhealthy individuals

algorithm that differentiates healthy and unhealthy commensal patterns.

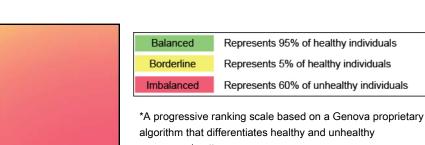

\*\*The total number of commensal bacteria (gPCR) that are out of balance for this individual on a scale of 0 to >12.

## **Relative Commensal Abundance**

|                         | -50% | -25% +25<br>Healthy Cohort | 5%   |
|-------------------------|------|----------------------------|--|
| Bacteroidetes Phylum    |      |                            | Increase in Bacteroides spp. and Odoribacter spp. seen in animal-based |
|                         |      |                            | diets; Prevotella increased with plant-based diet                      |
| Firmicutes Phylum       |      |                            | Contains many butyrate-producers; most species responsive to           |
| T IIIIIcutes F Hyldill  |      |                            | plant-based diets; Faecalibacterium spp. is anti-inflammatory          |
| Actinobacteria Phylum   |      |                            | Bifidobacterium is increased with plant-based diets; Collinsella       |
|                         |      |                            | may be proinflammatory, and is elevated with a Western-diet            |
| Brotophastoria Dhylum   |      |                            | Some species may be proinflammatory; E. coli consumes simple           |
| Proteobacteria Phylum   |      |                            | sugars and is lower in individuals on plant-based diets                |
| Euryarchaeota Phylum*** | NR   |                            | Methanobrevibacter smithii is associated with methane                  |
|                         |      |                            | production and with diets high in carbohydrates                        |
| Fuesbasteria Dhylum     | NR   |                            | Certain Fusobacterium spp. may be proinflammatory and                  |
| Fusobacteria Phylum     |      |                            | increased on low fiber, high fat diets                                 |
|                         |      |                            | Akkermansia spp. is involved in gut membrane integrity and             |
| Verrucomicrobia Phylum  |      |                            | may be increased with polyphenols and prebiotics                       |

Relative Abundance: The relative abundance compares the quantity of each of 7 major bacterial phyla to a healthy cohort. This can indicate broader variances in the patient's gut microbiome profile. Certain interventions may promote or limit individual phyla when clinically appropriate. Please refer to Genova's Stool Testing Support Guide for more information on modulation of commensal bacteria through diet & nutrient interventions. \*\*\*Approximately 70% of the healthy cohort had below detectable levels of Methanobrevibacter smithii. Approximately 90% of the healthy cohort had below detectable levels of Fusobacterium spp.

The gray-shaded portion of a quintile reporting bar represents the proportion of the reference population with results below detection limit.

Commensal results and reference range values are displayed in a computer version of scientific notation, where the capital letter "E" indicates the exponent value (e.g., 7.3E6 equates to 7.3 x 10<sup>6</sup> or 7,300,000).

The methodology for the PCR Commensal Bacteria has been updated to qPCR. The reference ranges have been updated accordingly.

The names of some of the bacteria have been updated as a result of taxonomy changes and method improvements.

Methodology: DNA by qPCR

Methodology: Culture/MALDI-TOF MS, Automated and Manual Biochemical Methods, Vitek® 2 System Microbial identification and Antibiotic susceptibility

Ρ

Pathogen

#### **Gastrointestinal Microbiome (Culture)**

Human microflora is influenced by environmental factors and the competitive ecosystem of the organisms in the GI tract. Pathogenic significance should be based upon clinical symptoms.

Microbiology Legend

PP

Potential

NP

Non-

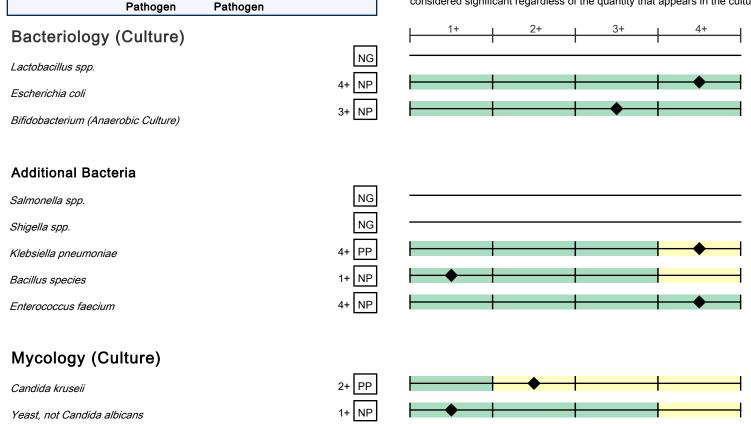

NG

No Growth

#### Additional Bacteria

**Non-Pathogen:** Organisms that fall under this category are those that constitute normal, commensal flora, or have not been recognized as etiological agents of disease.

**Potential Pathogen:** Organisms that fall under this category are considered potential or opportunistic pathogens when present in heavy growth. **Pathogen:** The organisms that fall under this category have a well-recognized mechanism of pathogenicity in clinical literature and are considered significant regardless of the quantity that appears in the culture.

## **OPTIONAL ADD-ON**

## **KOH Preparation for Yeast**

#### Methodology: Potassium Hydroxide (KOH) Preparation for Yeast

#### Potassium Hydroxide (KOH) Preparation for Yeast

These yeast usually represent the organisms isolated by culture. In the presence of a negative yeast culture, microscopic yeast may reflect organisms not viable enough to grow in culture. The presence of yeast on KOH prep should be correlated with the patient's symptoms. However, moderate to many yeast suggests yeast overgrowth.

#### Result

KOH Preparation, stool

Rare Yeast Present

The result is reported as the amount of yeast seen microscopically: Rare: 1-2 per slide Few: 2-5 per high power field (HPF) Moderate: 5-10 per HPF Many: >10 per HPF

## Parasitology

#### **Microscopic O&P Results**

Microscopic O&P is capable of detecting all described gastrointestinal parasites. The organisms listed in the box represent those commonly found in microscopic stool analysis. Should an organism be detected that is not included in the list below, it will be reported in the Additional Results section. These results were obtained using wet preparation(s) and trichrome stained smear. For an extensive reference of all potentially detectable organisms, please visit www.gdx.net/product/gi-effects-comprehensive-stool-test

#### **Prescriptive Agents:**

Oregano Uva-Ursi

The R (Resistant) category implies isolate is not inhibited by obtainable levels of pharmaceutical agent.

The I (Intermediate) category includes isolates for which the minimum inhibition concentration (MIC) values usually approach obtainable pharmaceutical agent levels and for which response rates may be lower than for susceptible isolates.

The S-DD (Susceptible-Dose Dependent) category implies clinical efficacy when higher than normal dosage of a drug can be used and maximal concentration achieved.

The S (Susceptible) column implies that isolates are inhibited by the usually achievable concentrations of the pharmaceutical agent.

NI (No Interpretive guidelines established) category is used for organisms that currently do not have established guidelines for MIC interpretation.

Refer to published pharmaceutical guidelines for appropriate dosage therapy.

#### Natural Agents:

In this assay, inhibition is defined as the reduction level on organism growth as a direct result of inhibition by a substance. The level of inhibition is an indicator of how effective the substance was at limiting the growth of an organism in an in vitro environment. High inhibition indicates a greater ability by the substance to limit growth, while Low Inhibition a lesser ability to limit growth. The designated natural products should be considered investigational in nature and not be viewed as standard clinical treatment substances.

Methodology: Vitek 2® System Microbial Antibiotic susceptibility, Manual Minimum Inhibition Concentration

### Mycology Sensitivity

## Candida Susceptibility Profile for Azoles\*

| Ormoniam             | Number      | % Sensitive |              |  |
|----------------------|-------------|-------------|--------------|--|
| Organism             | of Isolates | Fluconazole | Voriconazole |  |
| Candida albicans     | 25561       | 99.19%      | 99.51%       |  |
| Candida parapsilosis | 8777        | 98.64%      | 99.33%       |  |
| Candida kruseii      | 3420        | 0.23%       | 97.79%       |  |
| Candida tropicalis   | 1076        | 93.22%      | 90.57%       |  |
| Candida glabrata     | 2898        | 27.1%       | 90.9%        |  |

\*Results of pharmaceutical sensitivities against certain yeast species are based on internal Genova data pertaining to the frequency of susceptibility of the specific yeast to the listed antifungal agent. The pharmaceutical results are not patient-specific. Conversely, the results of inhibition to nystatin and natural agents are patient-specific.

### Non-absorbed Antifungals

| Candida kruseii  | LOW INHIBITION | HIGH INHIBITION |
|------------------|----------------|-----------------|
| Nystatin         |                |                 |
| Natural Agents   |                |                 |
| Candida kruseii  | LOW INHIBITION | HIGH INHIBITION |
| Berberine        |                |                 |

| Uva-Ursi         |                |                 |

#### Nystatin and Natural Agents:

Results for Nystatin are being reported with natural antifungals in this category in accordance with laboratory guidelines for reporting sensitivities. In this assay, inhibition is defined as the reduction level on organism growth as a direct result of inhibition by a natural substance. The level of inhibition is an indicator of how effective the substance was at limiting the growth of an organism in an in vitro environment. High inhibition indicates a greater ability by the substance to limit growth, while Low Inhibition a lesser ability to limit growth. The designated natural products should be considered investigational in nature and not be viewed as standard clinical treatment substances.
